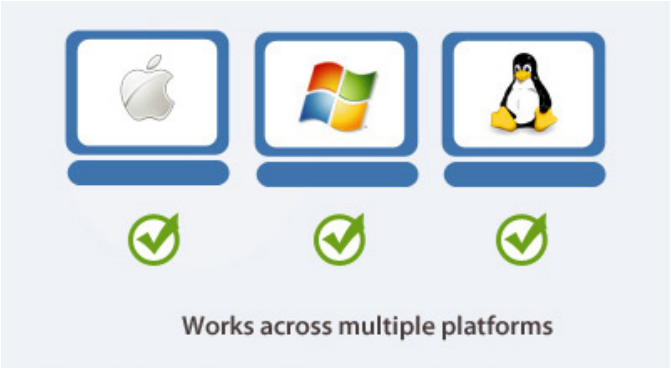
Introduction

The creators of the A-Team Fitness Tracker are proud to provided the latest in fitness tracking software. This software gives the user the ability to update, analyze, and plan their workouts and progress. The goal of this application to improve the health of people globally by improving awareness and providing motivation.



A-Team Fitness Tracker

The program is a Java based application that can be run on the user's home desktop or laptop computer and should be platform (operating system) independent. User's will register an account and be able to track their fitness progress over time. By registering an account, user's will have single factor authentication securing their personal information and lifting statistics.

System Features

- Java based application utilizing the latest JVM allowing for platform independence.
- Embedded H2 database reduces the number of third-party applications the user is required to install before running the program.
- Utilizes the Java standard JDBC library to connect to the H2 database for tested and proven methods for providing and retrieving information from the database.

Getting Started

System Requirements

The A-Team Fitness Tracker is a Java based application and should be operating system independent. However, for best user experience, it is strongly encouraged to use the A-Team Fitness Tracker on a desktop or laptop running Windows 10 or later. The latest version of Java should also be installed by the user prior to running this application.

Creating a User Account

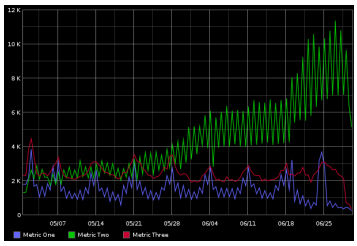
The first time you use the A-Team Fitness Tracker, you will need to register a user a user account. This will password protect your data and provide privacy while you undergo your fitness transformation. A user account can be created by click the "Create Account" Button on the landing page.

Logging Workout Data

You can log each work out by clicking the "Log Workout" button after signing into the application. This will allow you to track the number of reps, weight lifted, and exercise duration throughout your various workout phases.

Entering and Updating User Information

Weight, BMI and other information can be updated by clicking the "Track Progress" button. Weigh-Ins should be conducted monthly to provide the application with more data points to track. This will allow you to view your progress and analyze peaks and slumps.



Charts and Graphs

Graphs and charts displaying your progress have been implemented to provide you with better tools to analyze your performance. You can access these data visualization components by clicking "Graphs" in the toolbar.

Exiting the Application

You should exit the application by clicking the "Sign Out" button. This will allow the application to save your changes and improvements. The application will terminate after the "Sign Out" button is clicked.
